

# Access Control

Total Control. Zero Compromise.

## ✓ Proven Benefits

### ➤ Secure Every Entry Point

- Control who enters, when, and where
- Lock down sensitive areas
- Eliminate lost or copied keys

### ➤ Boost Operational Oversight

- Monitor and log entry activity
- Quickly grant or revoke access
- Support compliance efforts

### ➤ Enable Smarter Access

- Use fobs, mobile credentials, or biometrics
- Manage sites on a single platform
- Customize access by role, time, or zone

## How Proven IT Powers Your Business with Access Control

Access control is more than just managing doors, it's about managing risk. Proven IT's smart access control systems give you unmatched visibility and authority over who moves through your facilities.

Our scalable solutions integrate with video surveillance and alarm systems, giving you a unified platform to enhance security, streamline operations, and ensure compliance. Whether you need to manage one building or many, we help you do it securely and simply.

# Top Access Control Challenges Businesses Face Today

Traditional locks and outdated key systems create security gaps and administrative headaches. Lost keys, unauthorized copies, and lack of access tracking make it difficult to control who can enter sensitive areas.

## Lost Keys

Physical keys are easily lost, stolen, or copied, putting your facilities at risk. Replacing locks and keys is costly and time-consuming, often causing security gaps in the meantime.

## Manual Tracking

Relying on paper logs or spreadsheets to monitor who has access is inefficient and error-prone. Manual tracking makes it difficult to audit access events, spot suspicious activity, or maintain compliance.

## Delayed Revocation

When employees leave or lose access privileges, delays in revoking entry can create security vulnerabilities. Traditional key retrieval and rekeying processes are slow and often inconsistent.

## Multi-Site Complexity

Managing access across multiple locations with different systems or protocols can be a logistical nightmare. Disconnected systems increase administrative burden and risk inconsistent security enforcement.
